

Nairobi Depot: Night-Shift Slip & Trip Risk Is Elevated

Why we're sending this

A review of the Safety Command Center dashboard shows that **41% of night-shift incidents at Nairobi Depot are slips or trips** — the single largest category on that shift, and several occurred close to active work areas where a fall can quickly become something worse. Live monitoring confirms the walkway inspection control is currently flagged for attention. This is a pattern, not a one-off, and it's showing up now.

What to do before and during your shift

- **Check main walkways** before the shift gets busy — look for spills, loose mats, and blocked drains.
- **Clean spills immediately.** If you can't clean it right away, block it off and report it.
- **Call out hazards at handover** — wet floors, poor lighting, or anything blocking a walkway.
- **Slow down at corners and crossings**, especially near moving equipment.
- **Report near misses**, even minor ones — they're how we catch the next one early.

This isn't about blame. It's about catching a pattern in the data before it leads to someone getting hurt. Thank you for looking out for yourself and the person working next to you.
